AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. - 10. (Canceled without prejudice or disclaimer)

11. (New) A direct-conversion transmitting circuit,

characterized by a local modulation circuit comprising first and second mixers, and first and second low-pass filters, first and second gain/bias adjustment means, and a first phase shifter,

wherein high frequency output terminals of said first and second mixers are connected to each other; an output terminal of said first low-pass filter is connected to an input terminal of said first mixer; the input terminal of said first low-pass filter is directly connected to an output terminal of said first gain/bias adjustment means; the output terminal of the second low-pass filter is connected to an input terminal of the second mixer; the input terminal of the second low-pass filter is directly connected to an output terminal of said second gain/bias adjustment means; a first output terminal of said first phase shifter is connected to a local signal input terminal of said first mixer; a second output terminal of said first phase shifter is connected to a local signal input terminal of said second mixer; and input signals are applied to an input terminal of said first gain/bias adjustment means and an input terminal of said second gain/bias adjustment means, respectively,

wherein each circuit of said first and second low-pass filters is composed of a filter whose order is at least a second order, and

wherein said first and second low-pass filter circuits are each composed of a Sallen-Key type filter circuit,

the Sallen-Key type filter is composed of first and second resistors, first and second capacitors, and a first transistor, and a first terminal of said first resistor is an input of the filter; a second terminal of said first resistor is connected to a first terminal of said second resistor, a second terminal of said second resistor is connected to a base of the first transistor; a first terminal of said first capacitor is connected to the second terminal of said first resistor; a second terminal of said first capacitor is connected to an emitter of said first transistor; a first terminal of said second capacitor is connected to the second terminal of said second resistor; a second terminal of said second capacitor is connected to a grounding potential; a collector of said first transistor is connected to a power source potential; and an emitter of said first transistor is an output terminal of the filter.

(New) A direct-conversion transmitting circuit, 12. characterized by a local modulation circuit comprising first and second mixers, and first and second low-pass filters, first and second gain/bias adjustment means, and a first phase shifter,

wherein high frequency output terminals of said first and second mixers are connected to each other; an output terminal of said first low-pass filter is connected to an input terminal of said first mixer; the input terminal of said first low-pass filter is directly connected to an output terminal of said first gain/bias adjustment means; the output terminal of the second low-pass filter is connected to an input terminal of the second mixer; the input terminal of the second low-pass filter is directly connected to

an output terminal of said second gain/bias adjustment means; a first output terminal of said first phase shifter is connected to a local signal input terminal of said first mixer; a second output terminal of said first phase shifter is connected to a local signal input terminal of said second mixer; and input signals are applied to an input terminal of said first gain/bias adjustment means and an input terminal of said second gain/bias adjustment means, respectively,

wherein each circuit of said first and second low-pass filters is composed of a filter whose order is at least a second order, and

wherein each of said first and second low-pass filter circuits is composed of two sets of first and second Sallen-Key type filter circuits,

said first and second Sallen-Key type filter circuits are each composed of a first, second, third, and fourth resistors, a first and second capacitors, and a first and second transistors,

a first terminal of said first resistor is an input terminal of said filter circuit; a second terminal of said first resistor is connected to a first terminal of said second resistor; a second terminal of said second resistor is connected to a base of said first transistor; a first terminal of said first capacitor is connected to the second terminal of said first resistor; a second terminal of said first capacitor is connected to an emitter of said first transistor; a first terminal of said second capacitor is connected to the second terminal of said second resistor; a second terminal of said second capacitor is connected to a grounding potential; a collector of said first transistor is an output terminal of said filter circuit; a first terminal of said third resistor is connected to the emitter of said first transistor; a second terminal of said third resistor is connected to a grounding potential; a collector and a base of said second transistor are connected

Application No.: 10/073,029 Art Unit: 2685

Docket No. 843.41127X00

to the first terminal of the first resistor; a first terminal of said fourth resistor is connected to an emitter terminal of said second transistor; and a second terminal of said fourth resistor is connected to a grounding potential,

each of said first and second gain/bias adjustment means is composed of: a first differential pair serving as a voltage/current converter circuit that converts a differential voltage into a differential current; and a second and third differential pairs comprising a first and second collector output terminals, a first and second base input terminals, and an emitter coupling input terminal, and

a first collector output terminal of said first differential pair is connected to said input terminal of said first Sallen-Key filter circuit; a second collector output terminal of said first differential pair is connected to an input terminal of said second Sallen-Key filter circuit; an output terminal of said first Sallen-Key filter circuit is connected to an emitter coupling input terminal of said second differential pair; an output terminal of said second Sallen-Key filter circuit is connected to an emitter coupling input terminal of said third differential pair; first collector output terminals of said second and third differential pairs are connected to each other; second collector output terminals of said second and third differential pairs are connected to each other; a second base input terminal of said third differential pair is connected to a first base input terminal of said second differential pairs; and a first base input terminal of said third differential pair is connected to a second base input terminal of said second differential pair.

13. (New) A direct-conversion transmitting circuit, characterized by a local modulation circuit comprising first and second mixers, Application No.: 10/073,029 Art Unit: 2685

Docket No. 843.41127X00

Page 6

and first and second low-pass filters, first and second gain/bias adjustment means, anda first phase shifter,

wherein high frequency output terminals of said first and second mixers are connected to each other; an output terminal of said first low-pass filter is connected to an input terminal of said first mixer; the input terminal of said first low-pass filter is directly connected to an output terminal of said first gain/bias adjustment means; the output terminal of the second low-pass filter is connected to an input terminal of the second mixer; the input terminal of the second low-pass filter is directly connected to an output terminal of said second gain/bias adjustment means; a first output terminal of said first phase shifter is connected to a local signal input terminal of said first mixer; a second output terminal of said first phase shifter is connected to a local signal input terminal of said second mixer; and input signals are applied to an input terminal of said first gain/bias adjustment means and an input terminal of said second gain/bias adjustment means, respectively, and

wherein said first and second mixers are each composed of a differential circuit, and Input terminal pairs of said first and second mixers are provided with a first and second DC offset correction circuits to which output terminal pairs are connected,

each of said first and second DC offset correction circuits is composed of a control means having a DA converter, an AD converter, and two outputs,

one output of said control means is connected to an input terminal of said DA converter; the other output of said control means is connected to an input terminal of said AD converter; respective output pairs of said DA converter and said AD converter are connected to each other and thereby are said output terminal pairs,

and

the control means operates said DA converter before the direct-conversion transmitting circuit generates a signal, converts the signal to a logical signal in accordance with a magnitude of a DC component generated at each input terminal of said first and second mixers, and has a function of generating, from said AD converter, aDC level for offsetting the DC component on the basis of a value of the logical signal and a function of storing an optimal level converted into said logical signal.

(New) A direct-conversion transmitting circuit, 14.

characterized by a local modulation circuit comprising first and second mixers, and first and second low-pass filters, first and second gain/bias adjustment means, and a first phase shifter,

wherein high frequency output terminals of said first and second mixers are connected to each other; an output terminal of said first low-pass filter is connected to an input terminal of said first mixer; the input terminal of said first low-pass filter is directly connected to an output terminal of said first gain/bias adjustment means; the output terminal of the second low-pass filter is connected to an input terminal of the second mixer; the input terminal of the second low-pass filter is directly connected to an output terminal of said second gain/bias adjustment means; a first output terminal of said first phase shifter is connected to a local signal input terminal of said first mixer; a second output terminal of said first phase shifter is connected to a local signal input terminal of said second mixer; and input signals are applied to an input terminal of said first gain/bias adjustment means and an input terminal of said

Art Unit: 2685

Docket No. 843.41127X00

Page 8

second gain/bias adjustment means, respectively, and

wherein the direct-conversion transmitting circuit is composed of: a first and second control means each having a first and second DA converters, an AD converter, and two outputs; a DC offset correction circuit having a first, second, third and fourth output terminals pairs; and further a switching means having two sets of output terminal pairs.

an output of said first control means is connected to an input of said first DA converter; an output of said second control means is connected to an input of said second DA converter; an output pair of said first DA converter is connected to a first output terminal pair of said DC offset correction circuit; an output pair of said second DA converter is connected to a second output terminal pair of said DC offset correction circuit; and an output of said AD converter is connected to a third output terminal pair of said DC offset correction circuit,

said first and second mixers each are composed of a differential circuit, in which the first output terminal pair of said DC offset correction circuit is connected to an input terminal pair of said first mixer; the second output terminal pair of said DC offset correction circuit is connected to an input terminal pair of said second mixer; and the third output pair of said DC offset correction circuit is connected to an input terminal pair of said switching means,

one output terminal pair of said switching means is connected to the input terminal pair of said first mixer; and the other output terminal pair of said switching means is connected to the input terminal pair of said second mixer, and

each of said first and second control means operates said first and second DA converters before the direct-conversion transmitting circuit generates a signal, and
